What is claimed is:

- 1 1. A method of sampling fluid from a formation comprising:
- 2 (a) conveying a tool in a well borehole surrounded by the formation;
- delivering a first fluid through the tool using a fluid moving device located at a surface location, the first fluid exiting the tool at a distal end and returning to the surface location as a return fluid in an annulus between the tool and a borehole wall, the return fluid including the first fluid and cuttings;
- 9 (c) directing the first fluid from within the tool toward a portion of the borehole wall to remove material from an area on the wall portion;
- 12 (d) moving a pad member to the wall portion to seal the wall portion from the annulus; and
- 14 (e) exposing a first port to the sealed wall portion to sample formation fluid from the formation.
- The method of claim 1, wherein the tool is conveyed into the borehole on a drill string and the first fluid comprises drilling fluid.
- The method of claim 1, wherein directing the first fluid further comprises controlling pressure of the diverted first fluid to remove from the wall portion at least one of i) some mudcake and ii) cuttings.
- The method of claim 1, wherein directing the first fluid toward the wall portion further comprises directing the first fluid through the first port.

414-26216-US October 24, 2002

- The method of claim 1, wherein the tool further comprises at least one second port, and wherein directing the first fluid toward the wall portion further comprises directing the first fluid through the second port.
- The method of claim 5, wherein tool further comprises a first extendable probe, the pad being disposed on the extendable probe and the at least one second port is disposed spaced apart from the extendable probe.
- The method of claim 5, wherein the tool comprises an extendable member spaced apart from the pad member, the second port being disposed on the extendable member, the method further comprising extending second port prior to directing the first fluid toward the wall portion.
- The method of claim 7, wherein the extendable member is selected from a group consisting of (i) an extendable probe, (ii) an extendable stabilizer blade, (iii) a steering rib, and (iii) a gripper element.
- 1 9. An apparatus for sampling fluid from a formation comprising:
- 2 (a) a tool disposed in a well borehole surrounded by the formation;
 - (b) a fluid moving device at a surface location coupled to the tool for delivering a first fluid through the tool, the first fluid exiting the tool at a distal end and returning as a return fluid to the surface location in an annulus between the tool and a borehole wall, the return fluid including the first fluid and formation fragments;

9

- 10 (c) a fluid-diverting device for directing the first fluid from within 11 the tool toward a portion of the borehole wall for diverting the 12 fragments in the return fluid away from the wall portion;
- 13 (d) a pad member disposed on the tool, the pad member being
 14 moveable in relation to the wall portion for sealing said wall
 15 portion from the annulus; and
- 16 (e) a first port exposed to the sealed wall portion for sampling formation fluid.
- 1 10. The apparatus of claim 9, wherein the tool is conveyed into the borehole on a drill string and the first fluid comprises drilling fluid.
- 1 11. The apparatus of claim 9, further comprising a pressure control device for controlling pressure of the diverted first fluid to remove at least some mudcake from the wall portion.
- 1 12. The apparatus of claim 9, wherein the fluid-diverting device is coupled to the first port and the first fluid is directed toward the wall portion through the first port.
- 1 13. The apparatus of claim 9, wherein the tool further comprises at least one second port coupled to the fluid diverting device and the first fluid is directed toward the wall portion through the at least one second port.
- 1 14. The apparatus of claim 13, wherein tool further comprises a first
 2 extendable probe, the pad being disposed on the extendable probe
 3 and the at least one second port is disposed spaced apart from the
 4 extendable prob.

414-26216-US October 24, 2002

1	15.	The apparatus of claim 13, wherein the tool further comprises an
2		extendable member spaced apart from the pad member, the at least
3		one second port being disposed on the extendable member.

- 1 16. The apparatus of claim 15, wherein the extendable member is selected from a group consisting of (i) an extendable probe, (ii) an extendable stabilizer blade, and (iii) a steering rib.
- The apparatus of claim 9, wherein the tool further comprises at least one second port coupled to the fluid diverting device, the first port and at least one second port being disposed on the pad member and the first fluid is directed toward the wall portion through the at least one second port.
 - 18. A formation testing while drilling system comprising:
- 2 (a) a drilling rig for drilling a well borehole into the earth, the rig
 3 including a mud circulation system for flowing drilling fluid
 4 through a drill string;
 - (b) a tool disposed on the drill string and conveyed in the borehole, wherein the drilling fluid flows through the drill string and through the tool, the drilling fluid exiting the drill string at a distal end and returning as a return fluid to the surface location in an annulus between the drill string a borehole wall, the return fluid including the drilling fluid and formation fragments;
 - (c) a fluid diverting device in the tool for directing the drilling fluid from within the tool toward a portion of the borehole wall for diverting the fragments in the return fluid away from the wall portion;

15

16	` .	(d) a pad member disposed on the tool, the pad member being
17		moveable in relation to the wall portion for sealing said wall
18		portion from the annulus;
19		(e) a first port exposed to the sealed wall portion for sampling
20		formation fluid; and
21		(f) a surface controller for controlling at least a portion of a
22		drilling operation including formation testing.
1	19.	The system of claim 18, wherein the tool further comprises a
2	•	pressure control device for controlling pressure of the diverted first
3		fluid to remove at least some mudcake from the wall portion.
1	20.	The system of claim 18, wherein the fluid-diverting device is coupled
2		to the first port and the first fluid is directed toward the wall portion
3		through the first port.
1	21.	The system of claim 18, wherein the tool further comprises at least
2		one second port coupled to the fluid diverting device and the first
3		fluid is directed toward the wall portion through the at least one
4		second port.

22. The system of claim 21, wherein tool further comprises a first extendable probe, the pad being disposed on the extendable probe 2 and the at least one second port is disposed spaced apart from the 3

4 extendable probe.

5

The system of claim 21, wherein the tool further comprises an 23. 1 2 extendable member spaced apart from the pad member, the at least 3 one second port being disposed on the extendable member.

- The system of claim 23, wherein the extendable member is selected from a group consisting of (i) an extendable probe, (ii) an extendable stabilizer blade, and (iii) a steering rib.
- The system of claim 18, wherein the tool further comprises at least one second port coupled to the fluid diverting device, the first port and at least one second port being disposed on the pad member and the first fluid is directed toward the wall portion through the at least one second port.
